

What Should We Build First? Case Study Refactor

Spec for Claude Code. Target: ~1,300 words (cut from ~3000). Implement against /case-study-invoca-callreview.html.

Instructions for Claude Code

This document specifies a refactor of the case study HTML page. Apply the changes as described below.

Target file

Path: /case-study-invoca-callreview.html

Stack: React on Vercel, deployed via GitHub. Working directory is the tedpotter.com repo, opened locally in VS Code.

Current word count: ~3000 words

Target word count: ~1,300 words (verify after refactor)

Critical constraints

- **NO em-dashes (—) anywhere in the new copy.** Use commas, periods, colons, semicolons, or parentheses instead. This rule applies to all new copy in this document and to any existing copy you preserve. En-dashes in numeric ranges (e.g., 4–6M) are fine.
- **This spec is content-focused.** It tells you WHAT content goes in each section and WHERE each section sits in the page order. Layout, styling, component choices, and page chrome (top nav, footer, anchor nav, section labels) are out of scope. Use the existing site's visual patterns. Match the live VASA case study (/case-study-vasa.html) as the visual reference.
- **Preserve existing site chrome.** Top nav, footer, meta tags, in-page anchor nav, and the case study navigation links ("Next case study" / "Back to all work") all stay.
- **Keep existing image references where possible.** Do not break image links. If images need to be moved between sections, update the references but keep the same file paths.
- **Punchy H2 section titles.** Every H2 should carry a phrase the reader remembers, with one italicized hook word. Don't use functional labels like "Research" or "Process." Section-by-section H2 titles are specified below.

New page structure (top to bottom)

- **01. Hero Text Block.** Back link, breadcrumb ("CASE STUDY — [PROJECT NAME] · [N] MIN READ"), category pill tags, title, subtitle. Text only.
- **02. Hero image + product trio.** Full-width hero image (the existing project mockup) followed by 3 additional product screens displayed as a row/trio. 4 images total.
- **03. Impact stat cards.** 3 to 4 cards showing impact at a glance.
- **04. Project metadata.** Client, Agency, Role, Led, Team, Timeline, Platform.
- **05. The Problem (prose).** Scene-setting narrative.
- **06. My Role.** What I owned / What I partnered on.
- **07. Research + Insight.** How the truth was found and the reframe it produced.
- **08. The Work.** 2 to 4 named sub-beats.
- **09. Outcomes.** What shipped, validation, business impact.
- **10. Reflection.** What this work taught me.

Order of operations

- **1. Build the Hero Text Block.** Back link, breadcrumb ("CASE STUDY — [PROJECT NAME] · [N] MIN READ"), category pill tags, title, subtitle. Text only.
- **2. Place the hero image and product trio (Section 02).** Full-width hero image immediately below the hero text block, followed by 3 additional product screens displayed as a row/trio. 4 images total per case study.
- **3. Build the Impact stat cards (Section 03).** 3 to 4 cards. Use new stats listed below.
- **4. Build the Project Metadata cards (Section 04).** Client, Agency, Role, Led, Team, Timeline, Platform. Card layout.
- **5. Replace prose sections (05–10) with new copy.** Each section's new copy is provided below. Match the new H2 titles.

- **6. Apply migration notes.** Remove sections marked for deletion. Merge sections marked for merge. Relocate images marked for move.
- **7. Verify final word count.** Total prose (sections 05 through 10) should be in the 1,000 to 1,500 range. Hero block, image captions, stat labels, and bullet labels do not count toward this total.
- **8. After implementation,** ask the user to verify the page renders correctly on tedpotter.com after deployment to Vercel.

01. Hero Text Block

Top of page. Text only. Match the live VASA case study (/case-study-vasa.html) for visual reference.

Components (top to bottom)

- "← All work" back link (existing site chrome)
- Breadcrumb: "CASE STUDY — INVOCA CONTACT CENTER WORKFLOW · 6 MIN READ"
- Category pill tags: Enterprise B2B · Contact Center · Research-Led
- Title (large display type)
- Subtitle (one sentence)

Title

What Should We *Build* *First?*

Subtitle

How a focused week of research turned a vague mandate into a product direction, and a redesigned call review workflow grew Invoca's contact center product from \$4-6M to \$12-15M ARR.

02. Hero image + product trio

Insert AFTER the Hero Text Block. Visual proof, 4 images total.

Hero image (full-width product mockup)

figma-export/CRC Case Study/CRC-hero.png (hero mockup)

Product trio (3 screens displayed as a row below the hero)

- Note: Several "Image coming soon" placeholders exist in current case study. Replace with the most polished call list and call detail mockups available. Coordinate with Ted on which final images to use.

Note on image count

4 images total: 1 hero + 3 trio screens. If the case study currently lists more than 4 images, pick the 4 most representative. The hero should be the most polished overview shot; the trio should show distinct product surfaces or features.

03. Impact stat cards

Insert AFTER the hero image and product trio. 3 to 4 cards. Impact first, scope second.

Cards

- ~3x. ARR growth from \$4-6M to \$12-15M within two years of launch
- <6mo. From research to beta launch despite organizational headwinds
- 8. Customer accounts analyzed (FullStory, 58 individual call reviews)
- 5. Customer companies interviewed (8 users total)

04. Project metadata

Insert AFTER the impact stat cards.

Cards

Company: Invoca (B2B SaaS, AI-powered conversation intelligence platform)

Role: Senior UX Designer

Led: Initial research sprint, deep-dive customer research, end-to-end design from concept to ship, UX review process introduction with engineering

Team: UX lead partnered with PM Erick Montez, plus designers Jake Rowe and Brittany Choy on research execution

Timeline: 2023-2025, ~2 years

05. The Problem

H2 title (use as section header): A product *fighting* its own users

New copy

In early 2023, the VP of Invoca's contact center product asked a simple question: what should I build first?

Invoca had a contact center product uncomfortably bolted onto a legacy marketing platform. \$4 to 6 million in ARR. It had customers, but it didn't have momentum. Invoca's planned onboarding was 75 days; the actual average was 92. In 2022, only 11 of 32 customers completed onboarding within the year. Less than half of customer accounts logged in each month. Of those that did, the engagement split was dramatic: a small segment of power users with extremely high event counts, and a long tail of users who barely touched the product.

The product had real users with real workflows. But it was fighting them.

06. My Role

H2 title (use as section header): Designer, *researcher*, process advocate

What I owned

- Conceived, pitched, and led the initial product-wide research sprint to identify investment priorities
- Designed and ran the deep-dive research plan: FullStory analysis (8 accounts, 58 reviews), customer interviews (5 companies, 8 users), competitive analysis across industries, heuristic review
- Synthesized findings into a prioritized problem framework that aligned PM, engineering, and leadership
- Designed the Call Review Console from concept through shipped product
- Conducted concept testing directly with customers
- Established the UX review process with engineering, a practice that started here and carried forward

What I partnered on

- PM Erick Montez across the full research and design cycle
- Jake Rowe and Brittany Choy on interview execution and Dovetail synthesis
- Coordinated with CS, Sales Engineering, and Onboarding teams to gather internal evidence

07. Research + Insight

H2 title (use as section header): *Trust* in the data

New copy

I started with a one-week research sprint I conceived and pitched to product leadership: Pendo session replays to watch how users were actually navigating the product, conversations with the internal CS team, review of accumulated research that had minimal synthesis. Within that first week, the picture was clear: the Calls Report was the center of gravity. The workflow every contact center user touched daily, and the one they struggled with the most.

CEO Gregg Johnson asked to review the project. He paused at one point to ask if this was more research than the company typically conducted before a project. That moment captured the deeper challenge. Invoca's culture leaned toward building what users asked for rather than understanding the underlying problem. So we structured the research in shorter phases that could each earn continued investment, proving value incrementally rather than asking for trust upfront.

The deep dive ran for 30 days. Five customer companies, 8 users, 8 FullStory accounts analyzed. The pattern that emerged: users were spending entire workdays in a tool they didn't trust. Trust scores averaged around 50% across customers, with some as low as 10%. Without trust in the data, users were manually validating every call before they'd stake their reputation on insights or actions.

The reframe: this wasn't a UI problem, it was a trust problem. Every other issue, transcript quality, signal scoring, navigation, was a tributary feeding the same river. Until users could trust what the product told them at a glance, the

workflow couldn't function as the daily driver it needed to be. That framing turned a list of complaints into a single design priority: the call review workflow needed to surface what mattered, fast, in a form users could verify in seconds.

08. The Work

2 to 4 named sub-beats. Each is its own visual block with H3 header, prose, and supporting images.

Sub-beat 1: Helping Users Pick the *Right Call*

The most important design question: what content do users care about most when deciding whether a call is worth reviewing?

The answer became clear from the FullStory data. Users were racing through calls at under two minutes each because there was no intermediate layer of information between the call list and the full transcript. They had no way to preview what a call was about before committing to it. AI summaries filled that gap. I pushed for summaries to be the dominant content element in the call list, not tucked behind a click or treated as secondary to metadata.

I advocated for leading with filtering as the primary interaction, matching users' actual mental model rather than forcing them into a table-first layout that research had shown wasn't working. Cross-industry patterns from Kayak, Carvana, and Gong showed how mature products handled high-volume search.

Images: Keep: kayak_competitive_research.png, carvana_competitive_research.png (cross-industry research); Keep: mostfrequentpainpoints.png (pain points chart); Replace "Image coming soon" placeholders with final design screens.

Sub-beat 2: Building New Instead of *Patching Old*

The VP had initially approved smaller, targeted improvements to the existing Calls Report. As the deeper research findings accumulated, it became clear the problems weren't surface-level, they were structural. The page was a lead weight around our ankles.

I'd been advocating for building something new rather than patching the old system. One of the engineering directors helped push the decision over the finish line: sometimes it's easier to build something new than to contend with all the baggage and technical debt. We made the call to build a new flow from the ground up.

Images: Keep: Calls-Report-2023.png (current state for context); Keep: Calls-Report-current-stateflow-2023.png (current state workflow diagram)

Sub-beat 3: The *Hard Part* Wasn't the Design

Engineering leadership at Invoca was accustomed to having significant influence over what got built. They questioned the project repeatedly in early stages, not the design decisions, whether this was the right investment at all. Political conversations had to happen between product and engineering leadership to keep it moving.

There was also a process challenge. Engineers weren't used to having implementation reviewed by UX during development. The UX review concept was new and met with resistance. I had to sell the process to the team, not just the design. The framing that made it click came from an engineering manager: "It's like code review, but for UX."

We weren't just completing a project. We were helping parts of the company evolve into a different way of working: research informing decisions, design having a seat at the table through implementation, UX quality checked before shipping. That cultural shift created friction. The precedent it set mattered for everything that came after.

Images: No new images needed; this sub-beat is prose-driven.

09. Outcomes

H2 title (use as section header): From \$4-6M to *\$12-15M ARR*

New copy

Beta launched after about six months. The CS team started hearing praise instead of complaints. Concept testing with customers had been overwhelmingly positive. The same Christus Health user who had rated her trust at 45% saw the call detail page and paused: "Oh my. Gimme a minute to soak it in. This is nice."

The contact center product grew from approximately \$4 to 6M ARR at project start to \$12 to 15M ARR within two years of the redesign launching. Roughly 3x growth. The Call Review Console didn't single-handedly drive that growth, but it removed the biggest barrier to it.

Post-launch, we kept iterating: comment filtering, “mark as reviewed” status (eliminating a workaround the onboarding team had built), helper content, “last viewed” so reviewers could pick up where they left off. Many of these features had been identified in the original research; we just hadn’t shipped them all at once.

The UX review process started with this project carried forward into subsequent work.

10. Reflection

H2 title (use as section header): The hardest part *wasn't the* design

New copy

The question that started this project, what should I build first, is one of the most important questions a product team can answer well. Most companies answer it with whatever users asked for most recently or whatever a sales rep needs to close a deal. We answered it with a week of research, and that week changed the trajectory of the product.

The hardest part wasn’t designing the solution. It was the organizational work. Earning buy-in in phases. Navigating product-engineering tension. Introducing a new process in the middle of a high-stakes project. That’s the work that determines whether good design actually ships.

Migration Notes

Specific changes to make to the existing HTML beyond replacing prose. Read carefully.

Sections to remove entirely

- The existing standalone “Customer Research,” “What We Found,” “FullStory Analysis,” “Competitive Research,” and “The Decision” sections are removed as standalone sections. Their content consolidates into Section 07 (Research + Insight) and Section 08 (The Work).
- The existing standalone “Concept Testing” section is removed. The Sherita Vance quote moves into Outcomes as the customer reaction.
- The existing standalone “Call Detail Page” section is removed. Content folds into Sub-beat 1 (Helping Users Pick the Right Call) as the second half of the design narrative.
- The existing standalone “Post-Launch” section is removed; its content moves into Outcomes as a single paragraph.

Sections to merge / consolidate

- Existing Research, Customer Research, What We Found, FullStory Analysis, and Competitive Research sections consolidate into Section 07 (Research + Insight).
- Existing Design, Call Detail Page, The Decision, and Process sections consolidate into the 3 sub-beats of Section 08 (The Work).
- Existing Concept Testing and Post-Launch sections fold into Section 09 (Outcomes).

Images and assets to move

- Move CRC-hero.png and any final design mockups (call list, call detail, transcript view) UP to the new Section 02 (Hero image + product trio).
- Replace all “Image coming soon” placeholders. If final images aren’t ready, leave the placeholders but flag them for Ted to provide.
- Keep competitive research images (kayak, carvana, gong, observe.ai) inline in Sub-beat 1.
- Keep the current state Calls Report screenshot inline in Sub-beat 2.

Special considerations

- This case study has multiple “Image coming soon” placeholders. Flag these clearly for Ted to provide final design screens before deployment.
- Cap pull quotes at 2 maximum. Suggested: Sherita Vance reaction in Outcomes, and one of the trust score quotes in Research + Insight. The current case study has 6+ quotes; cut the rest.
- The existing in-page anchor nav at the bottom of the page should be updated to reflect the new section structure.
